Refund operations

TODAY

WITH THIS SYSTEM

Reconstruct the past, then test the alternatives

Three ordinary policy versions: a historical baseline, a proposed improvement and a deliberate tradeoff.

v1 · Reconstructed

Explain the old rule

Recovered from historical routing:
Amount below $55
Tenure at least 9 months
No prior refunds · clear risk
Change of mind within 14 days

Current in the demo

v2 · Proposed candidate

Use stronger evidence

Adds evidence-aware rules, repeat-refund and carrier checks,
a $300 review ceiling and
a $150 damage-refund cap.
A promising proposal to test.

Evaluate before rollout

v3 · Broader alternative

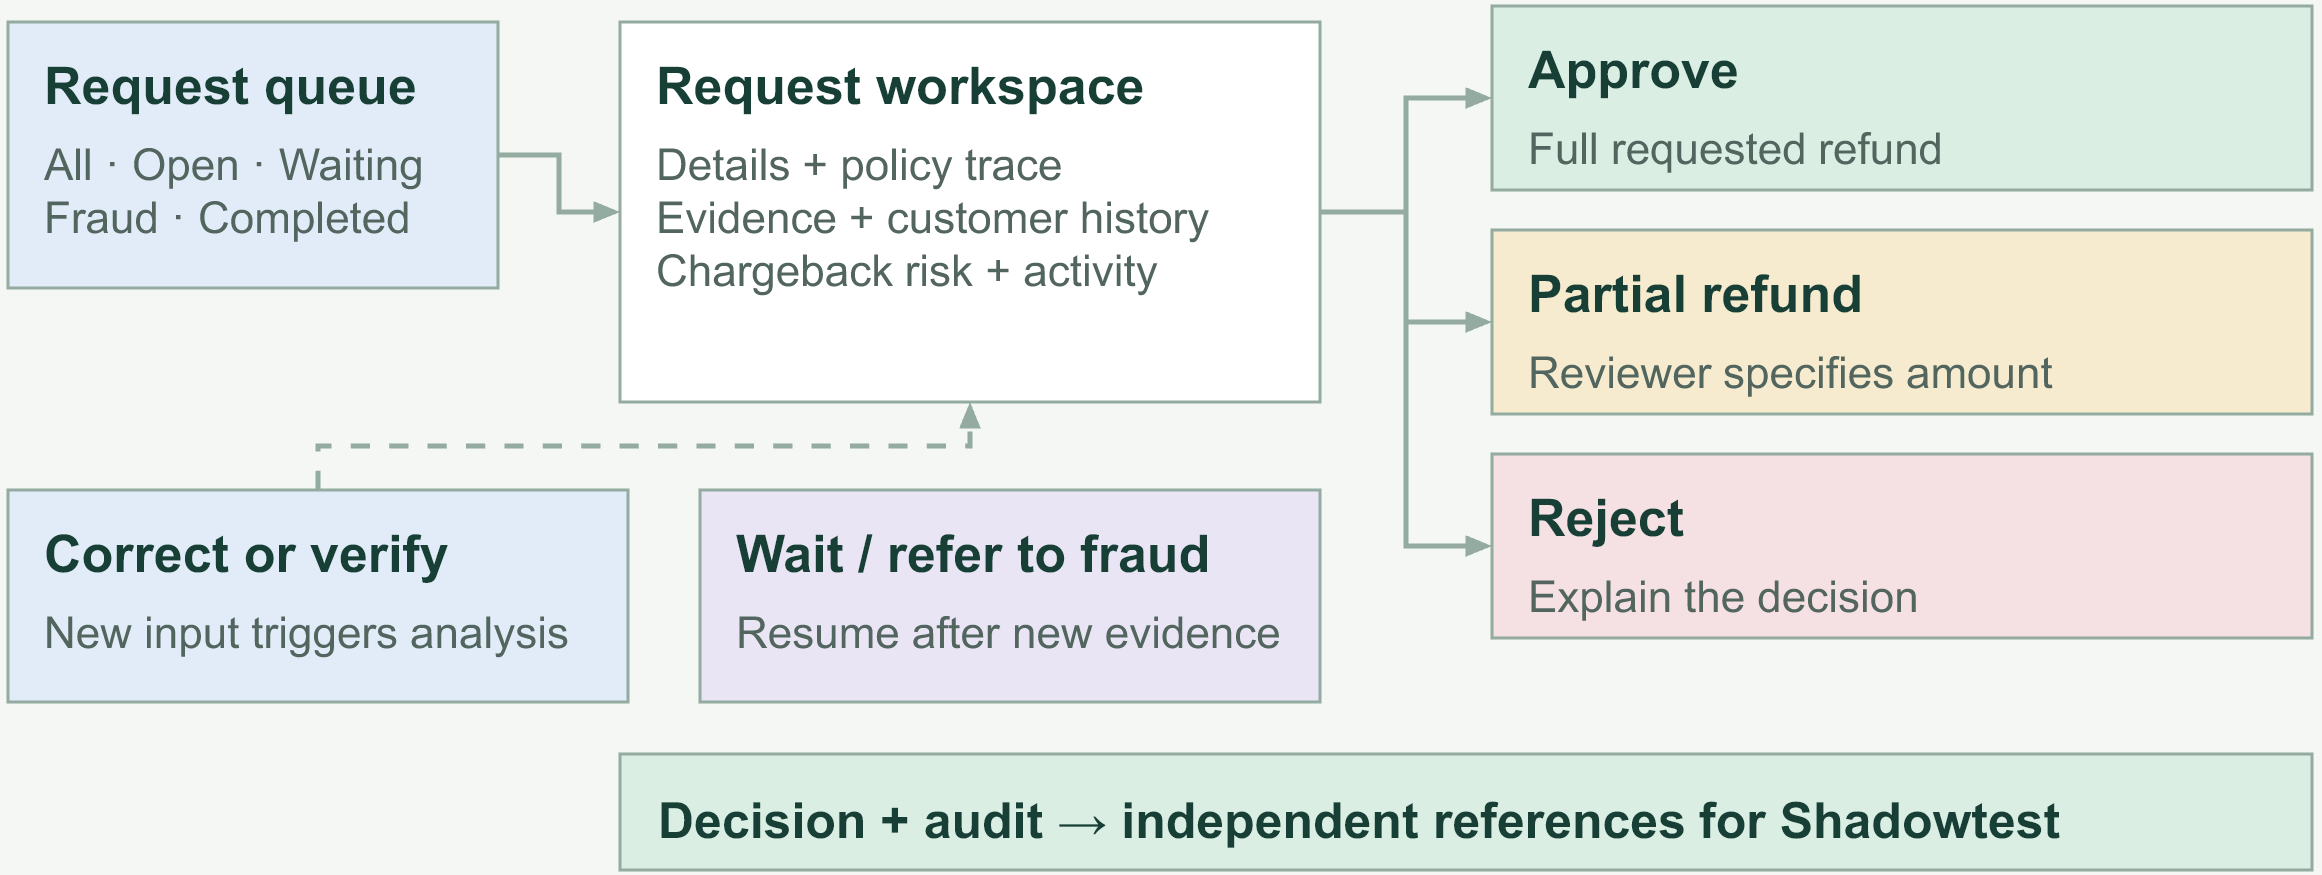

Expose the tradeoff

Apparel refunds up to $300, including repeat requests.
Fewer rules route to Review.
Shared safety checks stay.
More automation can cost more.

Compare benefit and exposure

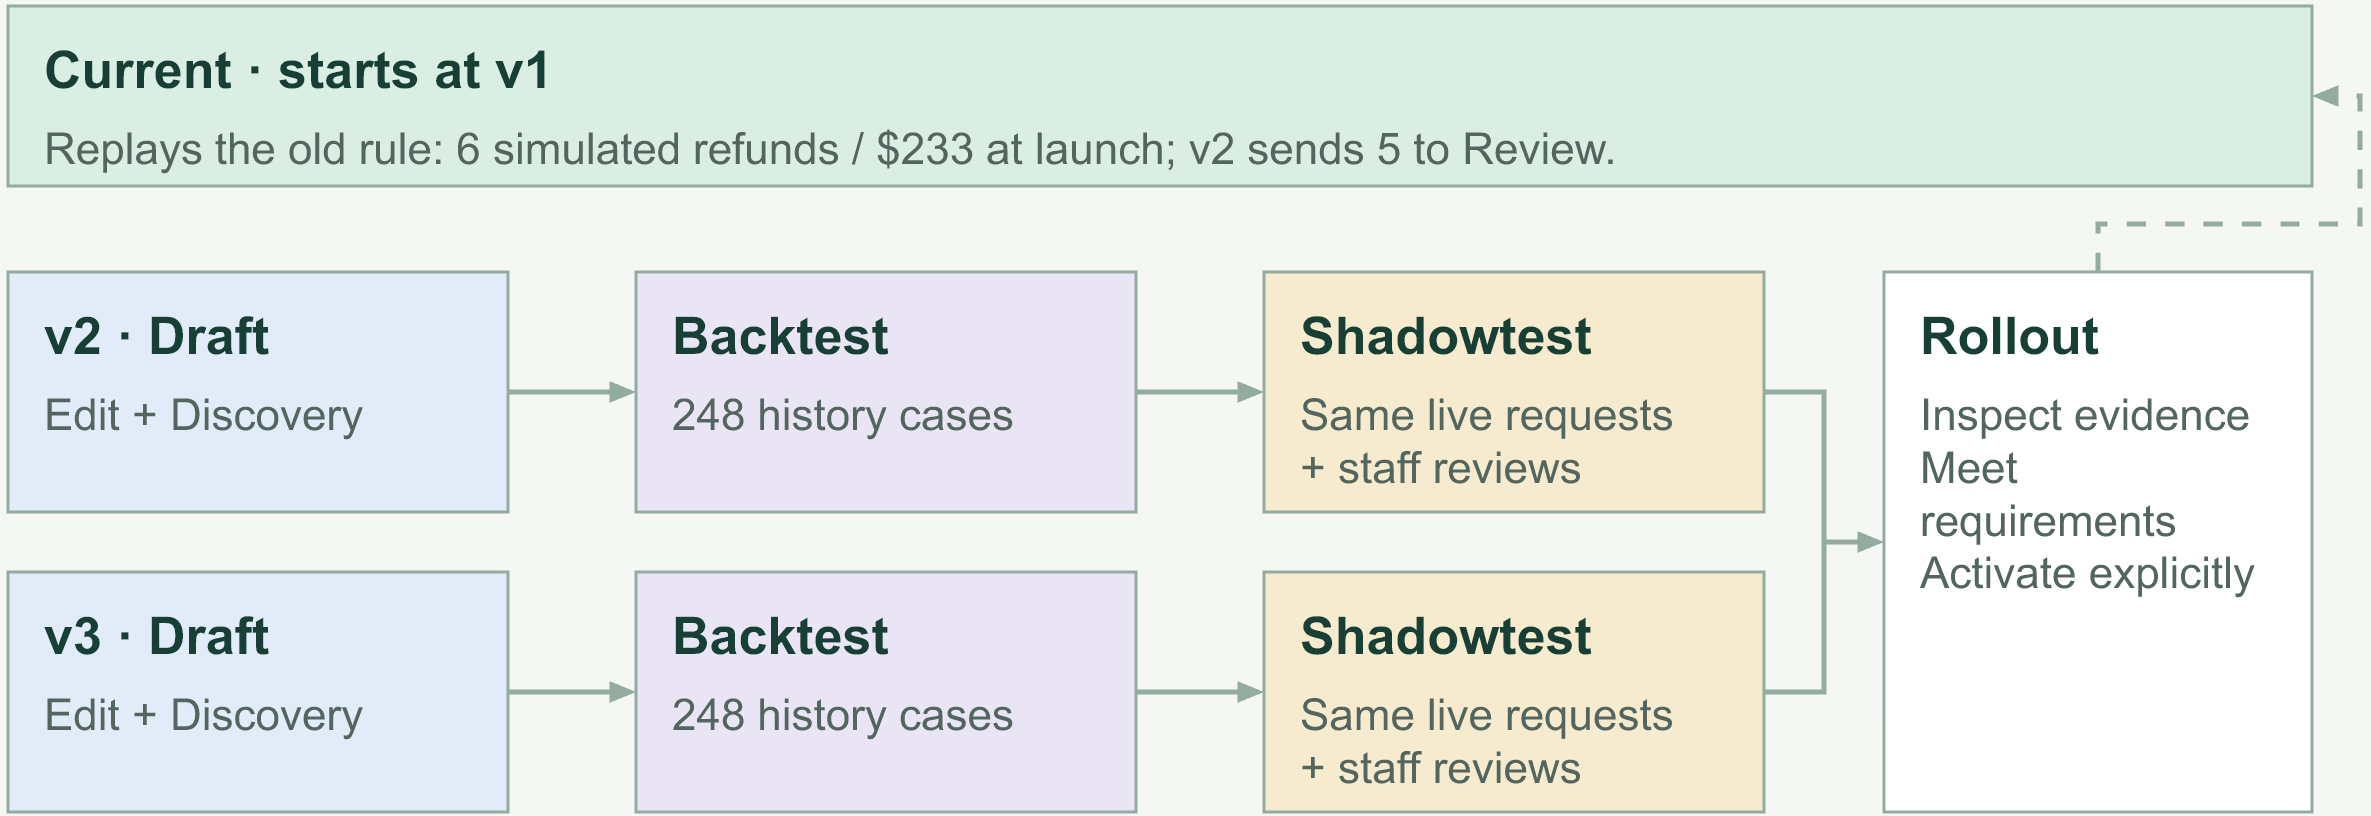

The same requests, extracted facts and engine make the versions comparable. No candidate is proven safe by this exposed sample.

Reviewer: evidence to decision, in one place

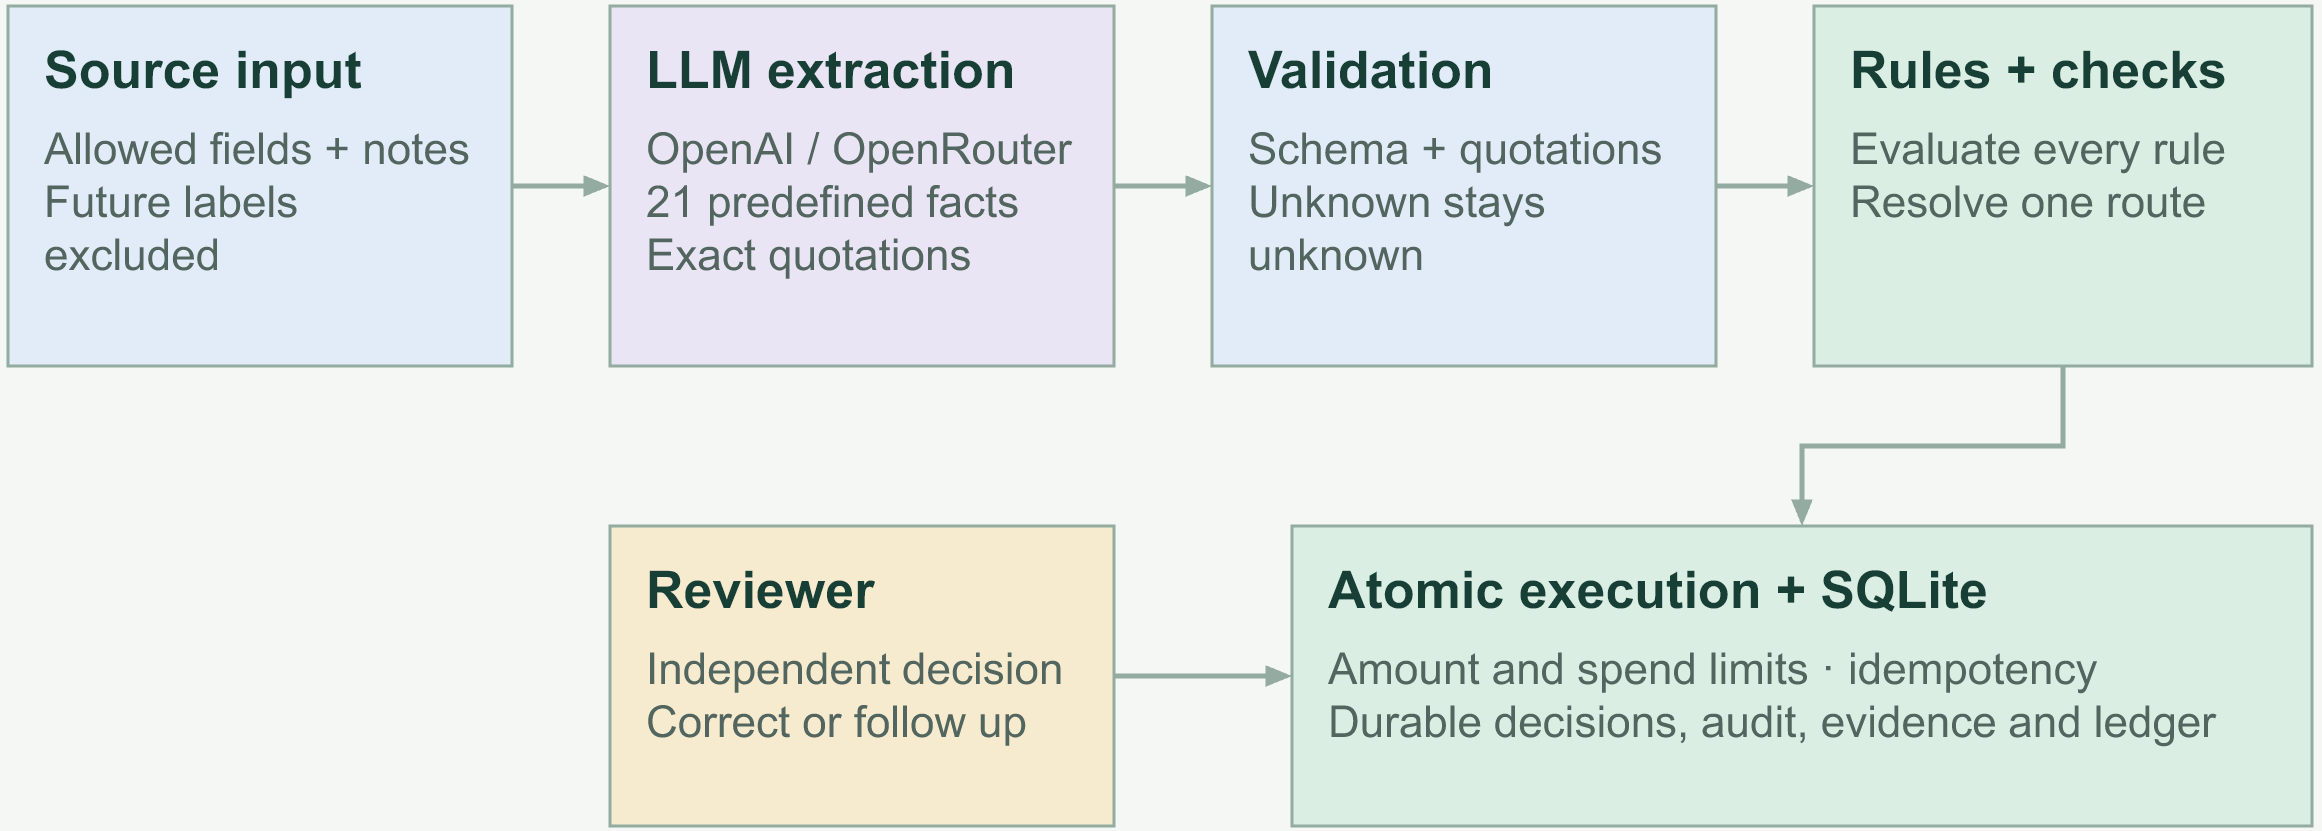

Many candidates, one shared evaluation path

v1 remains Current while v2 and v3 move from Draft through Backtest to Shadowtest.

Compare v1 / v2 / v3 together. Backlog is diagnostic; prospective evidence qualifies release.

AI reads meaning. Code controls money.

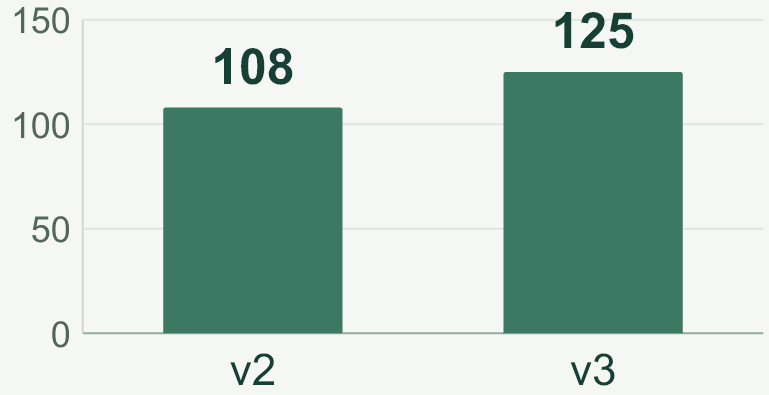

Same automation count, different decisions

Both automate 108 requests, but only 77 automatic requests are shared.

v1 Current		v2 Candidate
Auto Approve	77 stay automatic	Auto Approve
Auto Approve	31 now need Review	Review
Review	31 become automatic	Auto Approve

Also unchanged: 90 Review + 19 Fraud Review.

Automatic proposals / 248

Excess over assessed human amounts

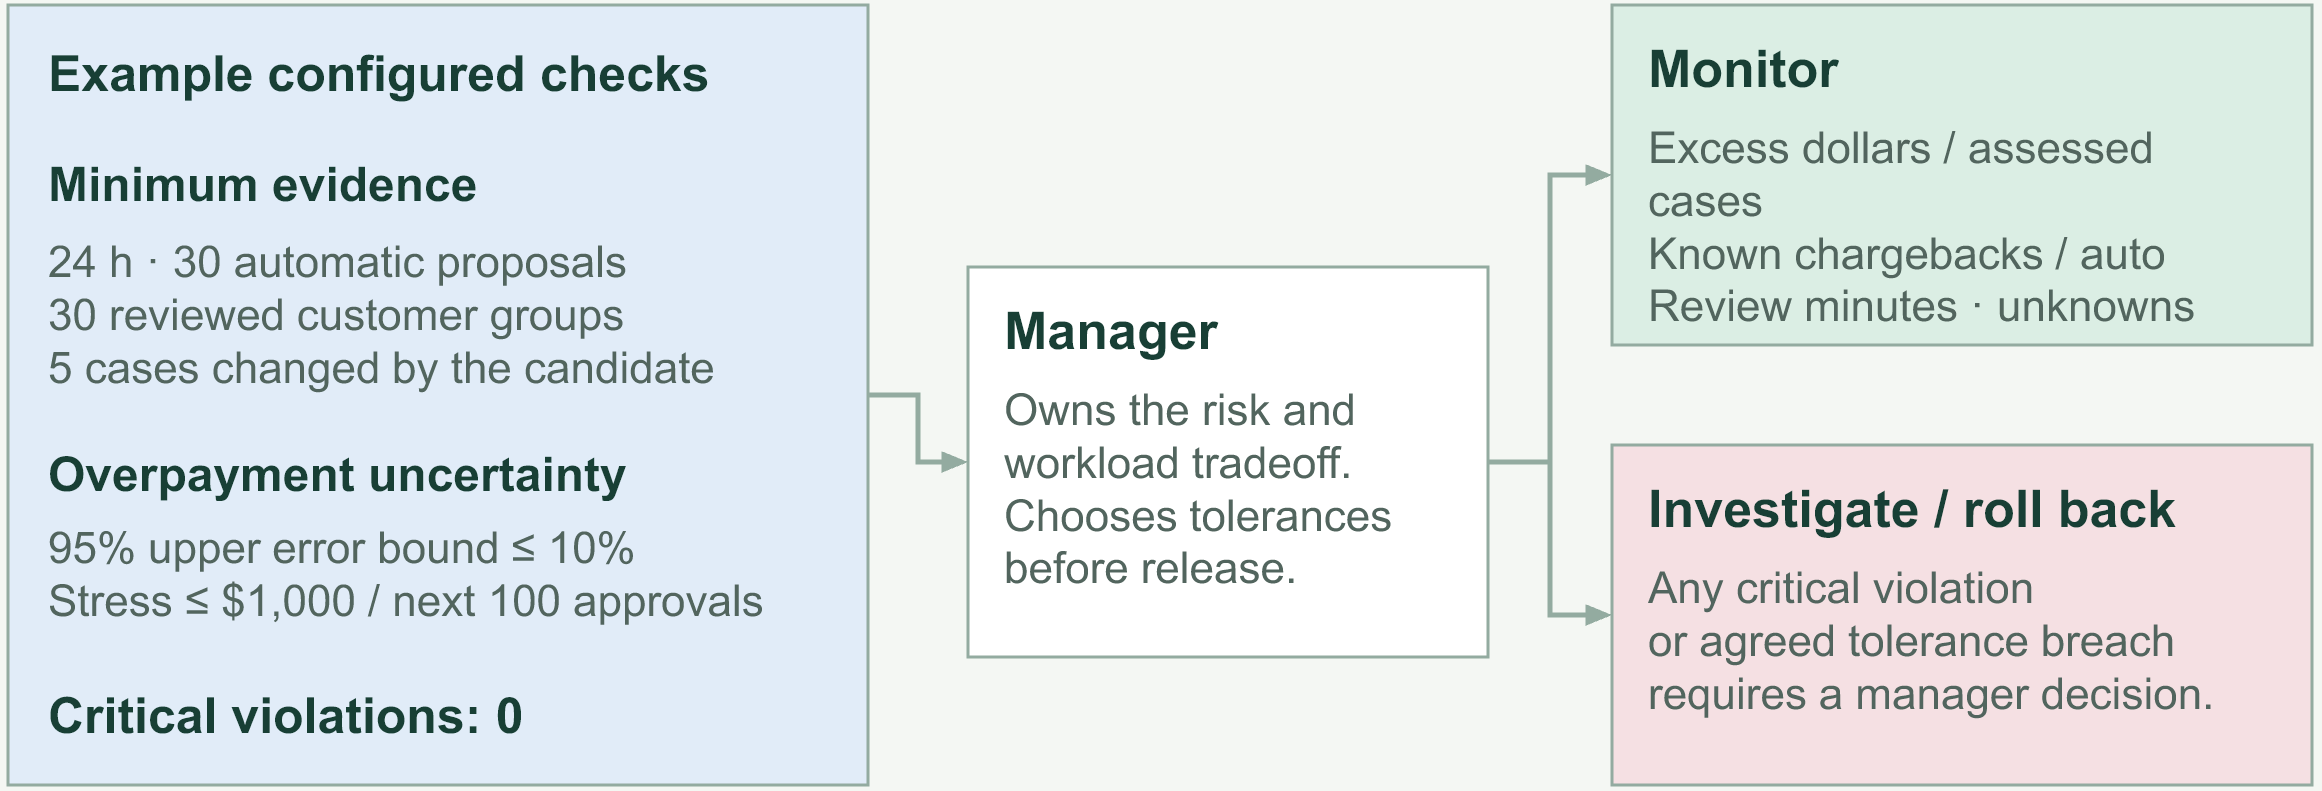

v2: $0 · 32 / 108 assessed

v3: $415 in 3 cases
44 / 125 assessed

Same 248 historical requests; 214 outcomes are unknown. Replay proposals and fallible human references do not prove safety.

Choose tolerances, then monitor the results

Release checks support a decision; they do not replace the manager's tradeoff.

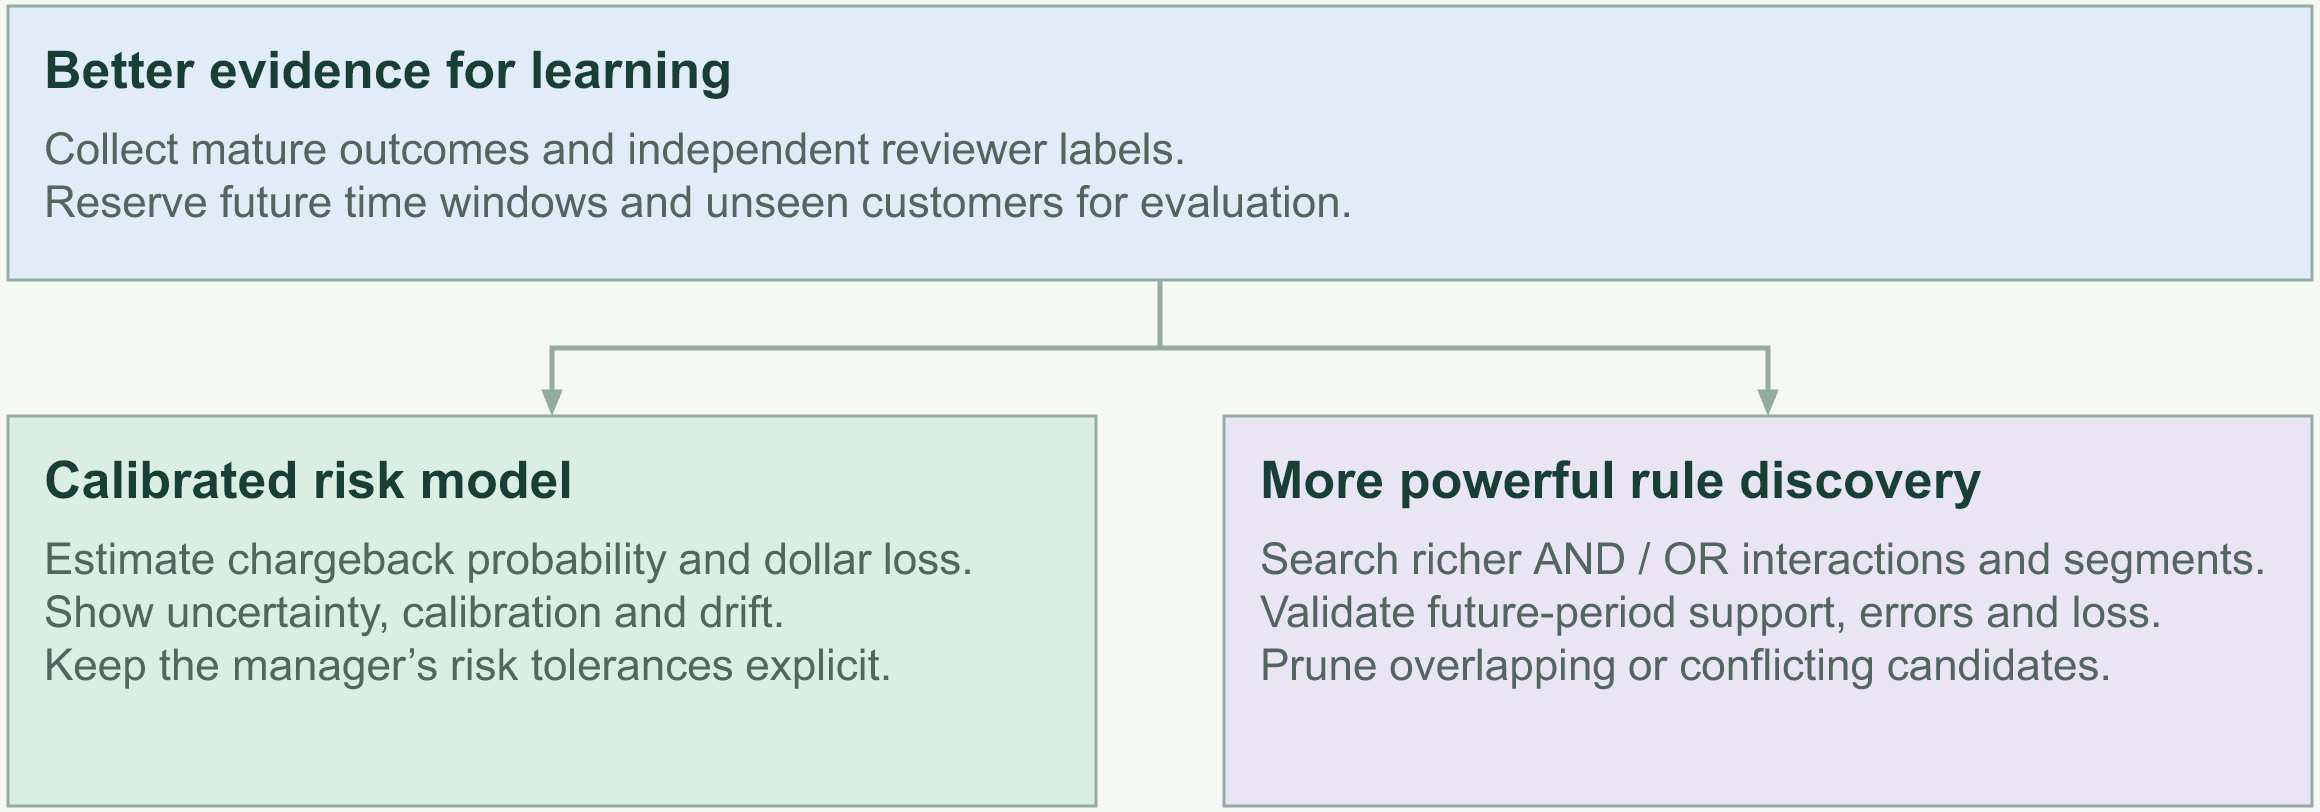

Example release settings, editable where allowed.
Not universal safety targets.

Existing ledger history stays intact.

What to build next

More useful risk estimates and candidate rules, supported by more independent data.

Proposals stay explainable. Managers inspect the evidence and choose which rules to release.
